

# ART OF SCIENCE 9.0 COMPARISONS

The Carl R. Woese Institute for Genomic Biology's Art of Science program is a celebration of common ground between science and art. Each exhibit comprises images from the IGB's research portfolio enhanced and transformed to highlight the beauty and fascination encountered daily in scientific endeavors.

This year's exhibit centers around a theme of comparisons. To compare is to take the time to observe, consider, read, and even measure similarities and differences. By building comparisons into this year's show we hope to invite you into a mode of perception that can reveal the beautiful work of science at the IGB.
